1.0 INTRODUCTION

The following report, related appendices and supporting documents are submitted in partial fulfillment of requirements of EPA Contract No. 68-01-7351, Work Assignment 301 entitled Records Compilation and Duplication for the Fisher-Calo Site. This project was performed to support EPA enforcement activities under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA). This report summarizes activities, assumptions and results for the project and includes the following major sections:

- 1.0 Introduction (Objectives, Background and Purpose)
- 2.0 Summary of work performed in identifying PRPs, compiling documents and summarizing reports
- 3.0 Summary of assumptions
- 4.0 Conversion methods used
- 5.0 Results of record compilation
- 6.0 Description of information available in data base files

Specific EPA requested appendices, computer reports and data support the following report material.

This introduction also describes the general purpose and objectives of the project, the scope of the work and a brief background on the project.

1.1 PURPOSE

The general purpose of this project was to support EPA action on the cleanup of a chemical packaging and distribution center located in Kingsbury, Indiana, commonly referred to as Fisher-Cal Chemicals. The objectives include organizing site records by PRP, identifying potential responsible parties (PRPs) with actual transactions, and developing a data base assessing the nature and extent of their transactions at the site.

1.2 SCOPE OF WORK

To accomplish the objectives of the project involved four general phases of work.

1. Sort, number and consolidate EPA documents on PRPs obtained from the site.
2. Identify two groups of potential responsible parties (PRPs) according to transactional records.
3. Compile a computerized data base on types of waste accepted by the site, waste volume, value of transactions and rank of PRPs in terms of volume and value of transactions occurring at the site.
4. Verify addresses for those parties with waste transactions documented in site records.

1.3 BACKGROUND

Starting in 1970, the Fisher-Cal Chemical company operated a chemical packaging and distribution center for Olin Mathieson Chemical Corporation. In 1972, Fisher-Cal began solvent reclamation operations at the site; and in 1974 purchased the site from Olin. Operations continued at the site until 1978

when a fire occurred which required activity to cease for a period. Operations were restarted in 1981 through 1985 as indicated by the transactions and site records provided by EPA for this records compilation work assignment.

2.0 SUMMARY OF WORK PERFORMED

The project followed closely the original scope of work (SOW) and work plan in satisfying the objectives of the work assignment. Specific activities are described below.

- o EPA Primary Contact provided the records to DPRA on May 10, 1987 and files were reviewed, sorted, and duplicates were removed. During this phase, the "Accounts" and "Receivables" files were consolidated into a single file for each PRP. Each file was organized chronologically from the earliest to the most recent date. Unique numbers were then stamped on the original documents sequentially beginning with 100001 and ending with 110067. Document numbers 109672-110067 are lab analyses, notes and tables providing only a chemical name. No account or company name was given, therefore, these were not incorporated into the PRP files. All sorting and stamping was completed on July 1. In an exception to the SOW, EPA decided duplicating the records would not be required because they had not sent 104E letter and would not need the records immediately for Freedom of Information (FOI) requests.
- o While reviewing and sorting the documents the project team extracted names and available addresses of all generators and transporters identified in the records, and prepared a list of all PRPs for the EPA. Many of the PRP files did not include records with transactions. Following EPA guidance, PRPs were set-up into two groups. The first group includes PRPs with records of transactions, primarily in the form of receiving reports and hazardous waste manifests. These are coded in the

standard 6-letter PRP code format. The second group contains those PRPs without actual records of waste shipments to Fisher-Calco but possibly had transactions as indicated by lab analyses, Fisher-Calco sales or marketing letters and other correspondence. These are identified by a "2" preceding the PRP Code; i.e. 2XXXXX. Also coded with a "2" prefix were three parties 1/ who only received material from Fisher-Calco based on file documentation. To further segment these parties their documents were placed in blue color-coded files.

- o PRP names and codes were computerized using the generic data base, Mailing Address System, in PRPBASE as provided by the U.S. EPA.
- o DPRA then entered transactional data for all PRPs using the generic program provided by the U.S. EPA. DPRA was responsible for coding, data entry, and quality assurance and followed coding forms provided in the PRPBASE Users Manual.
- o QA checks were completed and provided to EPA. While originally intended at three intervals, the rapid, straightforward entry rate actually led to the submission of only one major QA check. Initially the QA check on data entry included a check of errors on every 50th record and if error rates exceeded 1 in 20 records, every 10th record thereafter was checked until error rate attained 1 in 20 errors (95% error free). Unfortunately, the QA check did produce an error rate exceeding 5 percent for one data entry person. Therefore, this person's entries were then checked for every 10th record until the error rate improved. The predominant types of errors were entry of "0" instead of "Ø" (zero) or vice versa in Waste Codes, and misspelling of PRPCODES.

1/ American Chemical Service, Chem Met Services and Stauffer Chemical Company in Indiana.

Thus, most of the errors encountered in the QA check were either insignificant or errors that would be flagged during the validation.

- o The data base name for the site was FISHER and the password JACOBS was used to access the system. During data entry, the project team did not bypass the menu driven system of the generic data base provided by U.S. EPA.
- o While included in the original scope of work, the EPA had eventually indicated address verification would not be required for this work assignment. This decision was then reversed and verified addresses were requested for the 292 PRPs with transactions reported in the site documents. The verification process made use of several sources and began with the 1987 version of the Thomas Register. If an address from a different state was given, it was assumed the existing address was a branch of that company. Therefore, the assumed branch address was given an address type "2" (facility) and the directory address was given an address type "1" (primary) per PRPBASE procedures. Also used in the verification process was the Dun and Bradstreet Million Dollar Directory. The same procedure was followed for this directory. If PRP names were not found in either source, the Secretary of State for the state in which we had an unverified address was called. This procedure provided agent addresses which were entered in the database with an address type "1" (primary) and the agent's name was entered in the contact field. Also used in the verification process was directory assistance. The mailing address records contain verification coding in the contact field. Codes and descriptions used are as follows:

* - Address was verified
SS - Verified by the Secretary of State
OP - Verified by directory assistance
TR - Verified by the Thomas Register
DB - Verified by the Dun & Bradstreet Directory
TD - Verified by telephone directory
NL - No listing

A total of 31 PRP addresses were unable to be verified. These tasks were generally straightforward and proceeded at an acceptable pace.

3.0 SUMMARY OF ASSUMPTIONS

Key assumptions in compiling PRP lists and transactions data were as follows:

- o Transactions involving product sales (shipments of waste or recycled material from Fisher-Cal), laboratory sampling, transportation of waste to other sites, and pumping were excluded from the waste transactional database. Companies involved in only these activities were given a PRP Code with a two (2) prefix, referring to the second group of PRPs.

4.0 CONVERSION METHODS USED

Essentially all of the waste received at the Fisher-Cal site was in gallons and thus not requiring conversions. The existing conversion unit for pounds was the only other method used in converting.

5.0 RESULTS OF RECORD COMPIRATION

Results of the records compilations are presented in various reports either in appendices of this report or in computer reports delivered separately. These reports have been updated for this final report except for the large individual data transaction reports (Waste Transaction #3 & #5). These reports were not updated as changes have been minor in terms of name or address changes and did not involve any adjustments to transactions themselves. These results will be briefly highlighted in this section given the availability of PRPBASE computer summary reports. Key PRPBASE reports are:

- o Transactional Report #7, rank of PRPs by quantity of waste for:
 - "Site" file, and
- o Transactional Report #8, rank of PRPs by cost (dollar) of waste transactions for:
 - "Site" file.

A complete set of reports for this site include the following:

- o This project report and appendices,
- o Site: Waste Transaction Report #3, List of Waste Transactions (Unchanged from draft report.)
- o Site: Waste Transaction Report #5, Waste Type and Volumes (Unchanged from draft report.)
- o Site: Waste Transaction Report #7, Ranking of Potentially Responsible Parties by Total Waste Disposed
- o Site: Waste Transaction Report #8, Ranking of Potentially Responsible Parties by Total Cost of Disposal
- o Site: Waste Transaction Report #9, List of Transporters from the Transactional Database File
- o Site: Waste Transaction Report A, List of Transporters and the Companies They Served
- o Mailing Address Report #2, List of Individuals Not Sent Notice or Information Request Letters Addresses
- o Mailing Address Report #5, List of Individuals Without Street Addresses

Some of the highlights of these reports include the following:

- o The document review and sorting activities resulted in identifying 793 PRPs. Only 292 involved actual transactions of waste shipped to the Fisher-Calco site. The remaining 501 did not include documentation of actual transactions of wastes shipped to Fisher-Calco but documents (lab sample reports, sales letters, etc.) indicated transactions may have occurred.
- o Waste transactions from the site documents for the 292 generators accounted for 2.85 million gallons of waste at a cost of \$163,000

for the period of late 1980 to mid-1985. The largest single generator by volume was Reliance Universal Incorporated, disposing 346,000 gallons of waste or 12.2 percent of the total. The largest generator by value was General Motors with a total cost of \$52,854 for the disposal of 249,000 gallons of waste. Total disposal costs for General Motors equal 32.5 percent of the total. However, site records contained only limited information on the value of transactions as only 70 of the 292 PRPs contained any documents reporting transaction values. Thus value rankings are not as complete of an indicator of activity as volume data are. The ranking of generators are shown in Table 1 by volume and Table 2 by value.

6.0 INFORMATION AVAILABLE IN DATA BASE FILES

For this records compilation project three main data base files were used. The data bases included SITE.DBF, INV_SITE.DBF, and MAILING.DBF; and they were further supported by Auxiliary Files on waste codes, document types, disposal methods, conversion units and transporters. The recommendations/guidelines supplied in the PRPBASE OPERATOR'S MANUAL were followed throughout this project.
